

# IP Address Research: 5 Ways to Do It Explained

Posted on June 9, 2021

Personalization is the way to go when it comes to targeted marketing and advertising. Customers, existing and potential alike, want to feel that the brands they support care about their needs and try to predict what they might want. That's what makes IP address research critical for digital marketers and advertisers.

But they aren't the only ones who can benefit from IP geolocation data, cybersecurity pros, fraud protection agents, and market researchers do, too. Every computer or mobile device, after all, has a designated IP address that helps today's companies and individuals pinpoint where their strongest markets are, identify where threats likely come from, detect potentially fraudulent transactions, and predict consumption patterns and trends.

## 5 Lookups Explained for IP Address Research

There are tons of ways to locate an Internet user and we'll discuss them in greater detail in the next sections. You can choose one or more of them to improve your IP address research for any of your business- or cybersecurity-related processes.

### Option #1: Using a Bulk IP Lookup Tool

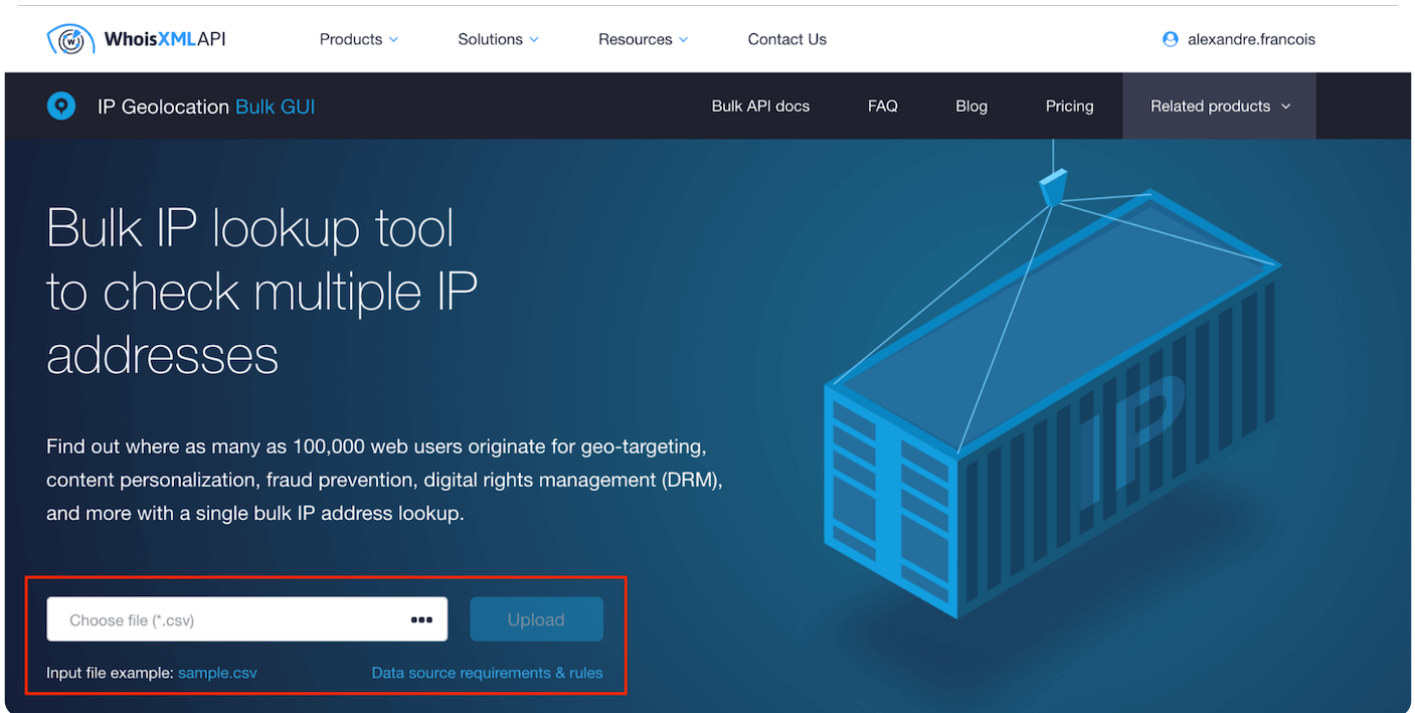

It's often the norm for any company that sells products online to keep a customer database. That's how marketers keep track of purchases, determine their loyal shoppers, personalize content, and take advantage of strategies like geo-targeting.

Logging IP addresses that come into contact with one's network, meanwhile, is also a given now since cyberattacks are widespread. IP address research is one of the means cybersecurity analysts use to determine an attacker's possible location, identify cybercrime hotspots, prevent fraud, and block access to and from threat sources.

A [bulk IP lookup tool](#) is an easy way to do IP address research. You can perform one in two ways.

You can upload a comma-separated values (CSV) file containing all of the IP addresses you wish

to query into the input field and click **Upload**. Alternatively, you can copy and paste all of the IP addresses from a network log, for instance, into the input field and click **Upload**. Wait a few minutes and download the results in CSV format.

Find out where as many as 100,000 web users originate for geo-targeting, content personalization, fraud prevention, digital rights management (DRM), and more with a single bulk IP address lookup.

Choose file (\*.csv)

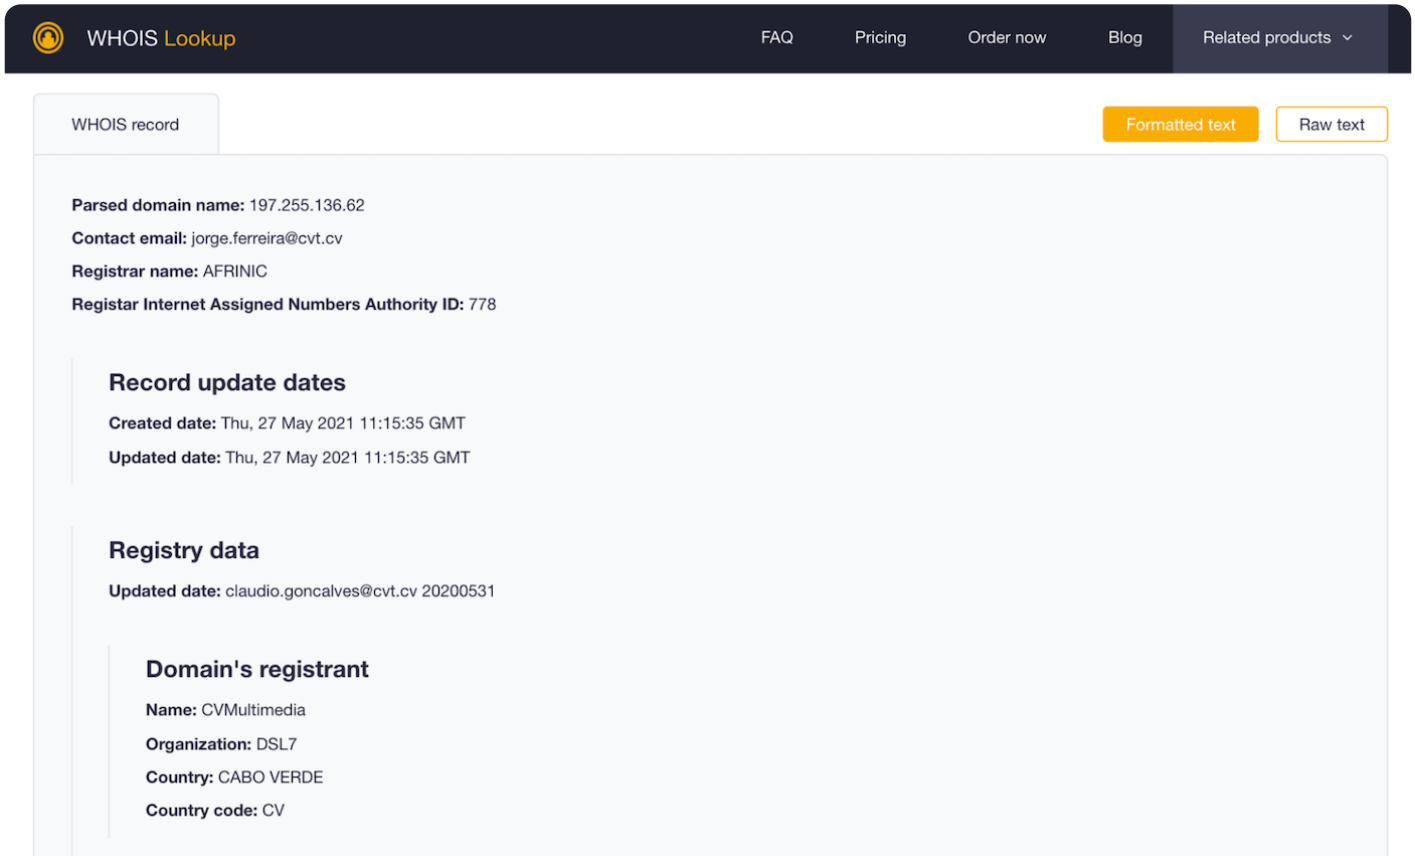

Input file example: [sample.csv](#) [Data source requirements & rules](#)

You will get an IP address list like the one below, which tells you the IP addresses' corresponding countries; regions or states; cities; latitude and longitude coordinates; postal codes; time zones; Internet service providers (ISPs); domain resolutions (maximum of three); and Autonomous System (AS) numbers, routes, domains, and types.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
1	Term	Resolved IP	Country	Region	City	Latitude	Longitude	Postal Code	Timezone	ISP	Domains	ASN	ASN Name	ASN route	ASN domain	ASN Type
2	8.8.8.8	8.8.8.8	US	California	Mountain Vie	37.40599	-122.07851	94043	-07:00	Google	0.cnxelg.top,	15169	Google LLC	8.8.8.0/24	https://about	Content
3	gmail.com	2607:fb0:40	US	California	Mountain Vie	37.38605	-122.08385	94041	-07:00	Google						
4	gmail.com	172.217.11.1	US	California	Mountain Vie	37.40599	-122.07851	94043	-07:00	Google	lax28s15-in-f	15169	Google LLC	172.217.0.0/1	https://about	Content

## Option #2: Using a WHOIS Lookup Tool

While WHOIS searches are more typically used to obtain domain ownership information, it is also useful for IP address research. An IP address search on a [WHOIS lookup tool](#) will tell you who or what company administrates it. Registry data can be useful in cybersecurity when it comes to reporting abuse.

The screenshot shows a web interface for a WHOIS lookup tool. At the top, there is a navigation bar with a logo and the text "WHOIS Lookup", and several menu items: "FAQ", "Pricing", "Order now", "Blog", and "Related products". Below the navigation bar, there is a tab labeled "WHOIS record" and two buttons: "Formatted text" (highlighted in orange) and "Raw text". The main content area displays the following information:

- Parsed domain name:** 197.255.136.62
- Contact email:** jorge.ferreira@cvt.cv
- Registrar name:** AFRINIC
- Registrar Internet Assigned Numbers Authority ID:** 778

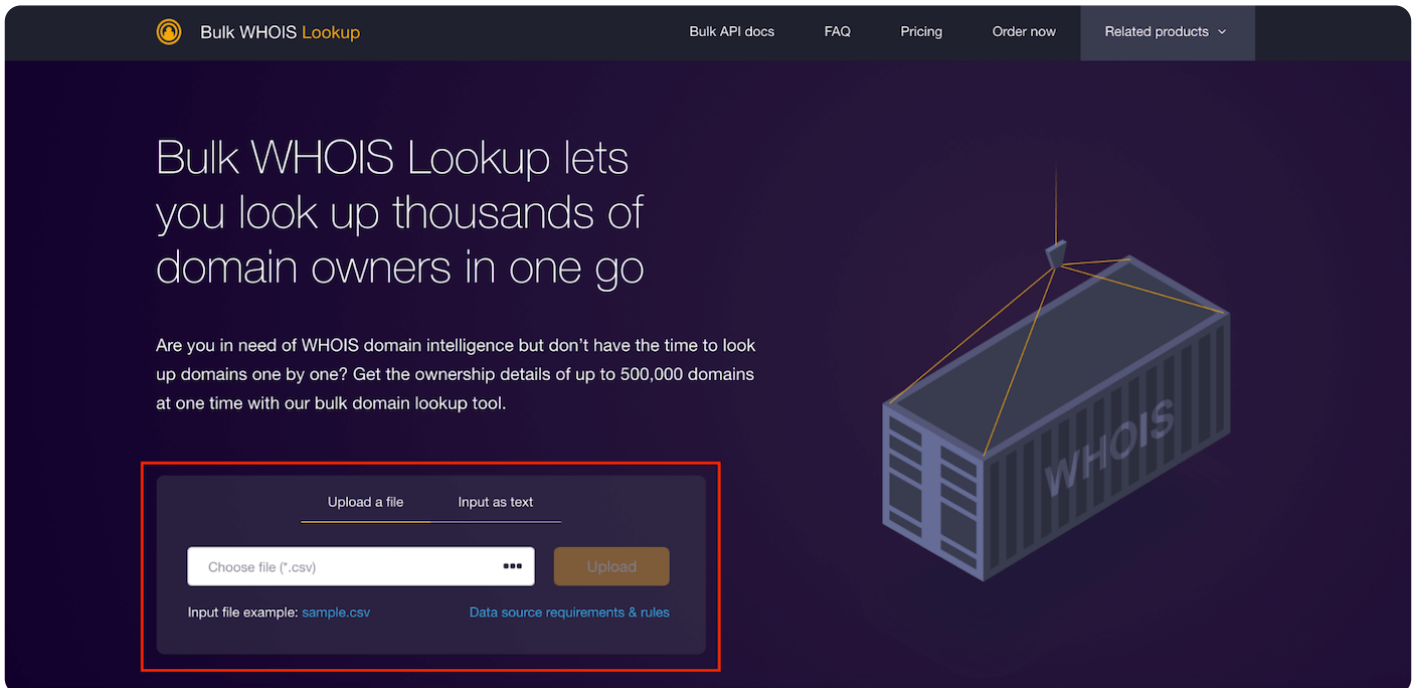

Below this, there are three sections:

- Record update dates**
  - Created date:** Thu, 27 May 2021 11:15:35 GMT
  - Updated date:** Thu, 27 May 2021 11:15:35 GMT
- Registry data**
  - Updated date:** claudio.goncalves@cvt.cv 20200531
- Domain's registrant**
  - Name:** CVMultimedia
  - Organization:** DSL7
  - Country:** CABO VERDE
  - Country code:** CV

## Option #3: Using a Bulk IP WHOIS Lookup Tool

[Bulk WHOIS lookups](#) provide the same results as an ordinary WHOIS search with one major

difference—you can query as many as 500,000 IP addresses at one time. You can use it the same way you would a bulk IP lookup tool. Upload a CSV file containing the IP addresses you'd like to query using the input field. Copying and pasting IP addresses into the field works as well.

The screenshot shows the 'Bulk WHOIS Lookup' interface. At the top, there is a navigation bar with links for 'Bulk API docs', 'FAQ', 'Pricing', 'Order now', and 'Related products'. The main heading reads 'Bulk WHOIS Lookup lets you look up thousands of domain owners in one go'. Below this, a sub-heading asks if the user needs WHOIS domain intelligence and offers a solution for looking up up to 500,000 domains at once. A central form is highlighted with a red border, featuring two tabs: 'Upload a file' (selected) and 'Input as text'. The 'Upload a file' tab contains a file selection input field labeled 'Choose file (\*.csv)', an 'Upload' button, and a link for 'Data source requirements & rules'. To the right of the form is a 3D illustration of a server rack with a 'WHOIS' label on its side.

Wait for the processing to finish and download the results. It should look something like this:

domainName	registrarName	contactEmail	whoisServer	domainAvailability	nameServers	createdDate	updatedDate	expiresDate	standardRegCreatedDate
171.96.192.170	APNIC	abuse@trueinternet.co.th					2011-12-06T00:10:15Z		
125.163.161.250	APNIC	abuse@telkom.co.id					2015-05-27T03:33:18Z		
171.97.35.117	APNIC	abuse@trueinternet.co.th					2011-12-06T00:10:15Z

58.97.72.83	APNIC	abuse@trueinternet.co.th					2011-12-06T00:10:15Z		
36.94.224.201	ORG-TI10-AP	abuse@telkom.co.id					2013-12-10T08:18:41Z		

## Option #4: Using a Reverse IP/DNS Lookup Tool

Passive Domain Name System (DNS) data such as that from reverse IP/DNS lookup tools can help with IP address research as well. The information you gain from such searches can be useful in additional threat artifact discovery, asset mapping, and indicators of compromise (IoCs) list expansion.

Given an IP address, you can identify all of the domains that resolved to it at one point in time. If you take the malicious IP address 186[.]236[.]14[.]64 identified by AbuseIPDB as of 27 May 2021, for instance, you would know that it's connected to the subdomain dynamic-186-235-14-64[.]ntcom[.]com[.]br.

### Recently Reported IPs:

 139.59.242.22	 212.92.204.54	 190.103.28.106	 212.179.245.210
 171.96.192.170	 103.123.64.19	 36.94.224.201	 58.97.72.83
 190.152.182.150	 171.97.35.117	 157.245.178.223	 45.177.111.57
 125.163.161.250	 178.151.34.43	 187.102.95.91	 95.79.36.55
 157.245.97.30	 103.123.246.54	 186.236.14.64	 125.25.82.191

186.236.14.64 reverse IP details

IP address

[New lookup](#)

Records matching the IP address: 1

dynamic-186-235-14-64.ntcom.com.br

First seen at: August 29, 2020

Date of the last update: April 30, 2021

If you would like to avoid the threats related to 186[.]236[.]14[.]64, therefore, avoiding dealings with dynamic-186-235-14-64[.]ntcom[.]com[.]br should become part of your cybersecurity strategy.

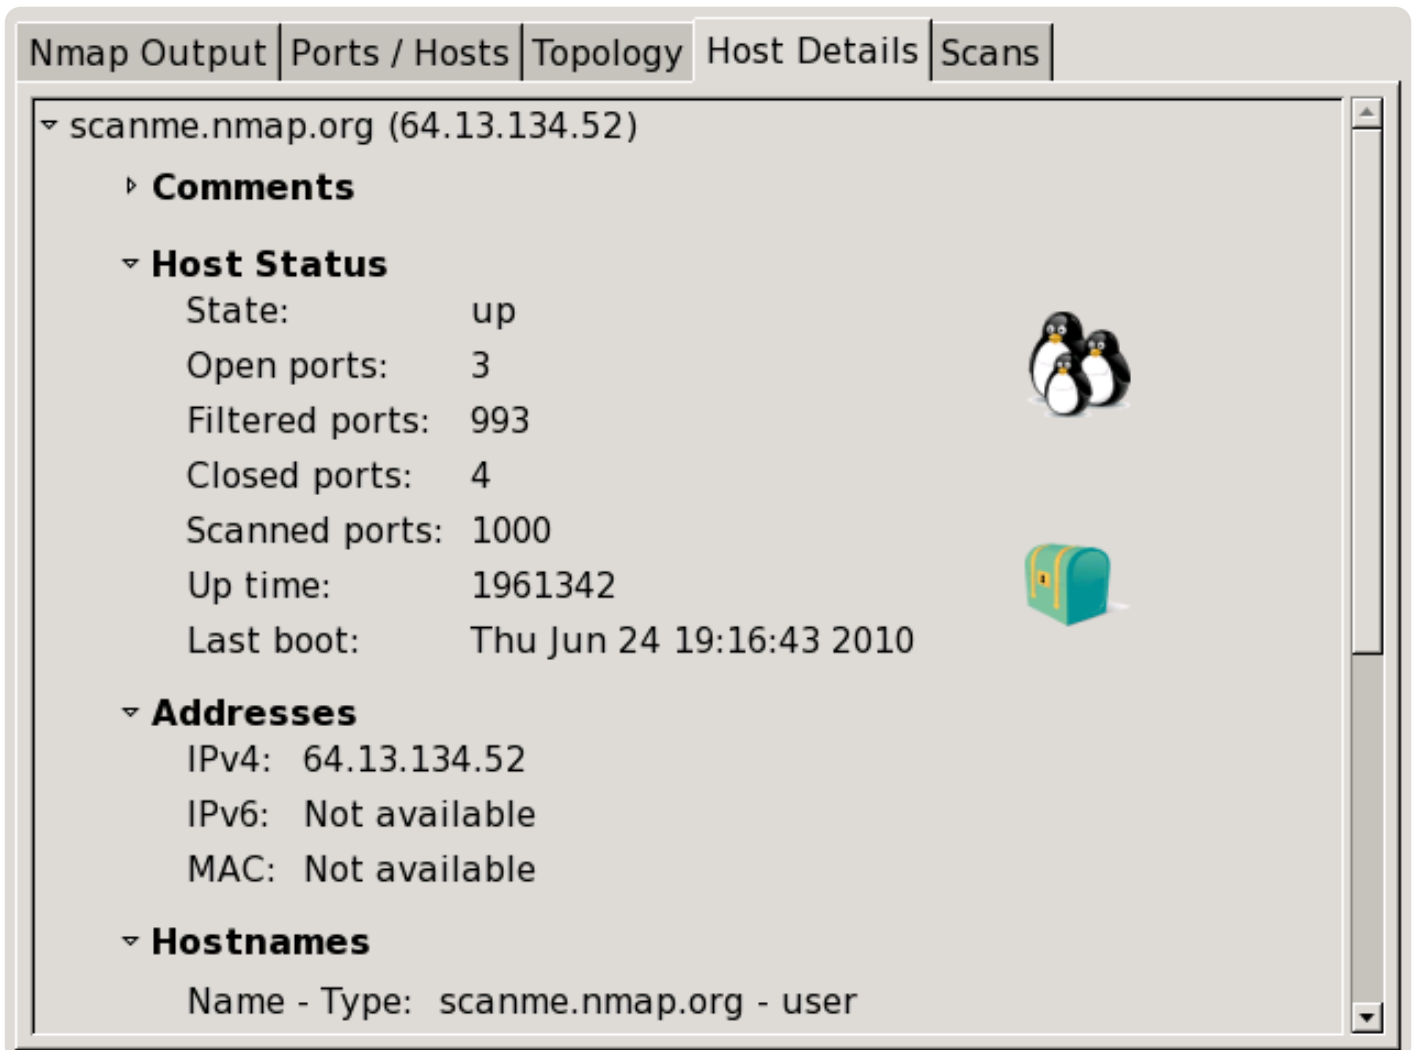

## Option #5: Using Nmap

Nmap is essentially an open-source network mapper and port scanner but is also useful for IP address research. To perform an IP address search, follow these steps:

- Download the version that's compatible with your system Nmap's website.
- Open the program. Type `# nmap -sL <IP address>`.

You should see a result that looks like this:

The screenshot shows the Nmap GUI with the following output for scanme.nmap.org (64.13.134.52):

- Comments**
- Host Status**
  - State: up
  - Open ports: 3
  - Filtered ports: 993
  - Closed ports: 4
  - Scanned ports: 1000
  - Up time: 1961342
  - Last boot: Thu Jun 24 19:16:43 2010
- Addresses**
  - IPv4: 64.13.134.52
  - IPv6: Not available
  - MAC: Not available
- Hostnames**
  - Name - Type: scanme.nmap.org - user

The interface includes a top navigation bar with tabs for Nmap Output, Ports / Hosts, Topology, Host Details, and Scans. The Host Details tab is active. There are also small icons of penguins and a mailbox on the right side of the output area.

## Making Your Choice

Among the ways to conduct IP address research mentioned above, it is generally more advantageous to use bulk options if you need to query thousands of IP addresses at one time. Bulk IP Lookup, for example, can give you the geolocation data of up to 100,000 users in one go while Bulk IP WHOIS Lookup can do so for 500,000 IP addresses at once.

The results from both Bulk IP Lookup and Bulk IP WHOIS Lookup also come in a format that you can easily correlate with other databases. You can also create charts using the IP address research data you collated by simply saving the CSV file as a spreadsheet using programs like Excel (on Windows) or Numbers (on macOS).

Your choice of IP address solution depends on your business requirements. If you wish to simply find the physical locations of thousands of users, use a bulk IP lookup tool. If you need to identify who is in charge of a particular IP address, you can opt for IP WHOIS Lookup or Bulk IP WHOIS Lookup. What's more, if you're mapping a potential cyber attacker's infrastructure, you may choose Nmap or passive Domain Name System (DNS) lookup tools like Reverse IP Lookup.
